EXPERIENCE

Fidelity Investments

Jersey City, NJ

Software Engineer

Jul. 2024 – Present

- Full-stack engineer on the migration of MSRB (Municipal Securities Rulemaking Board) regulatory reporting from mainframe to **AWS**, from early development through production parallel run and cutover
- Own the **Java/Spring Boot** backend API for the MSRB Cloud UI, exposing query, update, and delete operations across multiple trade types against **PostgreSQL**; took it through the enterprise API approval process (Swagger review, architect sign-off)
- Designed and built the experience authorization layer enforcing per-operation entitlements between the UI and backend; set up trade-account-level authorization with the internal account authorization teams
- Lead developer on the **Angular/TypeScript** tool replacing the mainframe screens, where business users query trades and reports with server-side pagination, filtering, and sorting on enterprise AG Grid; demoed to senior management and iterated on feedback
- Reworked **Terraform** and **Jenkins** pipelines from standard **EKS** deployments to blue/green, eliminating release downtime, and moved services from single-pod to multi-replica deployments
- Conducted enterprise disaster-recovery tests, failing over the application tier to a secondary AWS region alongside database failover and validating traffic routing and recovery; streamlined the failover procedure with **Kubernetes** scale-to-zero, cutting it from 15–30 minutes to under a minute

Associate Software Engineer

Jan. 2023 – Jun. 2024

- Traced legacy COBOL module specifications to confirm update, delete, and audit-logging behavior; co-developed the first version of the MSRB Cloud UI's trade query screens
- Built a daily **AWS Lambda** pipeline ingesting pipe-delimited branch files from the mainframe via **S3**, loading 17K+ branch records to date into PostgreSQL
- Set up the team's initial AWS configuration (Secrets Manager, S3) with Terraform and **Datadog** logging; established **JUnit** coverage and **SonarQube** quality gates and remediated security vulnerabilities

Rogers Communications

Toronto, ON

Software Developer Co-op

Jan. 2022 – Aug. 2022

- Automated Salesforce data maintenance in a DevOps team with **Python** and the **Salesforce Bulk API**, replacing manual update and deletion workflows and processing 3M+ record deletions
- Developed a **Python** and **Selenium** script to automate creation of Salesforce release notification banners, cutting completion time by 80%; onboarded and mentored an incoming co-op

EDUCATION

Georgia Institute of Technology

Aug. 2024 – May 2027

Master of Science in Computer Science — Spec. in Artificial Intelligence

GPA: 3.9

York University

Sep. 2019 – Dec. 2022

Honors Bachelor of Science in Computer Science

PROJECTS

ML Trading Strategy Learner | *Python, NumPy, pandas, Matplotlib*

- Built a rule-based strategy and a **bagged random-forest learner** (custom decision trees, 50 bags) generating long/short signals for JPM from four technical indicators with 5-day forward-return labels
- Backtested against a buy-and-hold benchmark with commission and market-impact modeling; manual strategy returned +14.1% out-of-sample vs. -8.3% benchmark

Net Worth Tracker (iOS) | *SwiftUI, TypeScript, Supabase, Plaid API*

- Building a personal-finance iOS app as sole developer with an **AI-assisted development** workflow, owning product scope, architecture, and integration decisions
- Integrated **Plaid** Hosted Link with server-side token exchange in **Supabase Edge Functions** so credentials never reach the client, syncing balances, transactions, liabilities, and holdings on a scheduled daily job

TECHNICAL SKILLS

Languages: Java, Python, SQL, TypeScript, HTML/CSS

Frameworks & Libraries: Spring Boot, Angular, JUnit, Mockito, scikit-learn, PyTorch, pandas, NumPy

Tools: Git, Docker, Kubernetes, PostgreSQL, AWS, Maven, Jenkins, Terraform, Datadog, Kafka, Insomnia, Swagger
